

Science museum extravaganza

We have recently been treated to a workshop with a twist, a science twist!

Our students had the chance to be involved in a science workshop. The primary and secondary students got their hands dirty making colourful slime!

The students had the chance to learn about different materials and the states we can find them in such as in a solid, liquid or gas state. In addition to this they also learnt about some odd substances that act as both solids and liquids. These

substances are called non-newtonian substances and their slime is an example of this.

The bubble show made us all feel like young kids again. We got to see some pretty huge bubbles and we even got to be inside a bubble!

Overall it was such a great experience and we look forward to having them at our school again.
